

Microlinea's wall-wash optical system is designed to evenly illuminate vertical surfaces such as white boards.

Whether used in a linear layout or in one of our dramatic patterns, Microlinea suspended fixtures enhance the style of any space while maintaining your architectural theme. Companion wall-mount units define spatial limits and highlight areas of interest.

LESS IS MORE

Trim and sleek, the Microlinea collection of luminaires offers a clean, uncluttered look that can be used to create texture and visual interest against today's less complex ceilings. Supporting T8, T5 and T5HO lamp options and a variety of optical controls, Microlinea gives you a wide range of lighting design capabilities.

MICROLINEA series

Precision Architectural Lighting

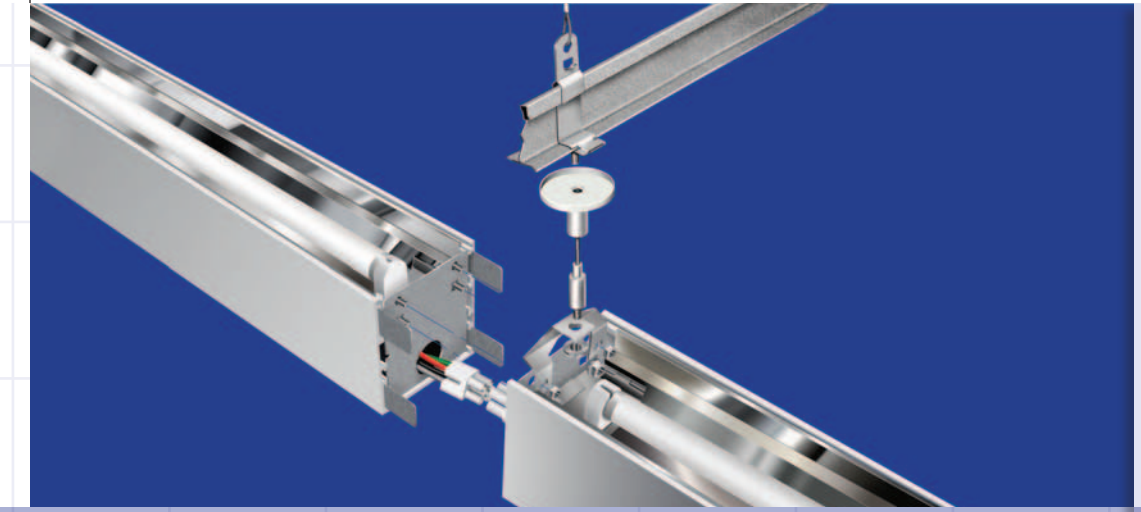

PAL's capabilities include a sophisticated powder coat process that enables us to duplicate natural finishes such as Knotty Pine, shown here, to match or accent architectural elements.

PRECISION CRAFTSMANSHIP

Microlinea suspended indirect/direct fixtures deliver even, glare-free overall illumination for large and small spaces, while companion wall-mount units highlight architectural features. Incorporating precision craftsmanship and quality materials, Microlinea uses the latest energy-efficient ballast technology and optics to support current energy initiatives.

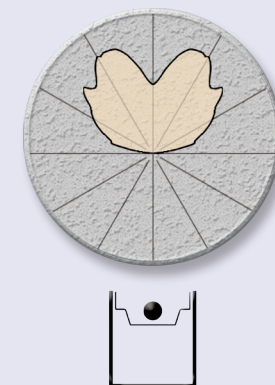

Microlinea saves on installation cost with its positive alignment system, quick-connect wiring and modular suspension for on-grid mounting.

A RANGE OF APPLICATIONS

Microlinea indirect fixtures provide the even, comfortable ambient light required to meet the needs of a range of institutional, business and retail environments. Compact in size, Microlinea is an ideal complement to both accent lighting and natural light, helping guide traffic while reducing operating costs.

An innovative cleated mounting system provides simple installation for wall-mount fixture runs of any length.

COMPACT FLEXIBILITY

Microlinea's standard components give the designer complete flexibility in creating unique patterns or continuous rows to meet the design demands of the project. This extends to our optical controls, including semi-specular or white baffles, and directional or linear prismatic lenses, which may be selected to achieve the desired illumination characteristics of the space.
